

FDA Authorized COVID-19 Vaccines

Clinical Trial & Emergency Authorization Timeline

*All three COVID-19 vaccines are **not FDA approved**. Instead, they were **authorized** for mass emergency use almost 2-3 years **before phase 3 clinical trials will end**. Initial studies are not complete and long-term reactions are unknown. How can safety be known?

*Since all three vaccines come with risk, adverse reactions are tracked through the CDC/FDA's official system called the [Vaccine Adverse Events Reporting System \(VAERS\)](#). To date, VAERS shows [329,021 cases reporting adverse reactions](#), including **5,888 deaths**, [2,190 heart attacks](#), and [652 miscarriages](#) (as of 6.04.21).

*The survival rate from COVID-19 is over 99% (it's still 95% for the elderly). If you're likely to survive COVID then **is it worth the risk** to take a non-FDA approved, experimental vaccine known to cause severe adverse reactions and even death?
