

THE CHILDREN

sacrificed for vaccine development

OVER 60 YEARS OF ABORTION FOR VACCINES

WI-38

I'm a girl from Sweden and would have celebrated my 61st birthday this year. I was aborted at 3 months gestation in 1962. My lung tissue was used to create the WI-38 fetal cell line, which is used in chickenpox, MMR and adenovirus vaccines. **Approximately 23 abortions** were used during the development of WI-38.

RA 27/3

I would have celebrated my 59th birthday this year. I was at least 3 months gestation when aborted in 1964. My lung tissue was used to create the RA 27/3 rubella virus strain, which is used in the rubella portion of the MMR-II & Proquad vaccines. I was the 27th abortion, but approx. 80 abortions were used during the research & development of RA 27/3.

MRC-5

I'm a boy and would have celebrated my 57th birthday this year. I was aborted at 3 1/2 months gestation in 1966 for psychiatric reasons from my physically healthy 27 year-old mother. My lung tissue was used to create the MRC-5 fetal cell line, which is used in chickenpox, shingles, polio, rabies & hepatitis A/B vaccines.

WALVAX-2

I'm a girl from China and would have celebrated my 8th birthday this year. I was aborted at 3 months gestation in 2015 using a method that ensured I was born & dissected alive. My lung tissue was used to create the WALVAX-2 fetal cell line (made to replace MRC-5). I was the **9th abortion** in this research.

The research & development of abortion-derived fetal cell lines have been continuous since the early 1960s. Some of the additional fetal cell lines (that can be purchased online) are: HEK-293, MRC-7, MRC-9, IMR-90, IMR-91, TIG-1, & PER.C6.
